Genomic Sciences Center and Genome Science Laboratory in RIKEN. Division of Experimental Annial Research in Riken contributed to prepare mouse tissues. First strand cDNA was primed with a primer [5, GAGAGAGAGATCCAAGAGCTTTTTTTTTTTTTTTYN 3'], cDNA was prepared by using trehalose thermo-activated reverse transcriptase and subsequently enriched for full-length by cap-trapper. CDNA went through one round of normalization to ROt = 5.0 and subtraction to ROt = 25.0. Second strand cDNA was prepared with the primer adapter
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        /tissue_type="tongue"

```
The present invention relates to phosphatase polypeptides, nucleotide sequences encoding them, as well as various products and methods useful for the diagnosis and treatment of various phosphatase-related diseases and conditions. Substance that modulates the activity of phosphatase polypeptide is used to treat immune-related diseases and disorders, and disorders, including cancers of tissues, cancers of netabolic disorders, including cancers of tissues, cancers of nematopoletic origin, diseases of central and peripheral nervous system, Alzheimer's disease, Parkinson's disease, multiple sclerosis, amyotrophic lateral sclerosis, viral infections, infections caused by prions, bacteria and fungi, ocular diseases, diabetes, ingraines, pain, disorders, hypotension, uppertension, psychotic disorders, neurological disorders, hypotension, uppertension, psychotic disorders, neurological disorders, hypotension, uppertension, psychotic disorders, neurological disorders, hypotension, dispendension, psychotic disorders, neurological disorders, dyskinesias and organ transplant rejection. The present sequence is a DNA encoding human SGP003 phosphatase (DSP) and MAPP CHIPIN CH
                                                                                                                                                                                                                                                                               Β.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                              brain or

                                                                                                                                                                                                                                                                                                                                                                                                             The present sequence encodes a human regulator of intracellular phosphorylation (HRIP). HRIP is useful for screening agonists and antagonists of HRIP polypeptide. HRIP and its agonist or antagonist or antagonists of HRIP polypeptide. HRIP and its agonist or antagonist care useful for treating a disease or condition associated with decreased or increased expression of functional HRIP. Diseases treated or diagnosed include neurological disorders such as stroke, Parkinson's disease, demyelinating diseases, bacterial and viral meningitis and other developmental disorders of the central nervous system.

The present invention relates to single exon nucleic acid probes (SENP). The present sequence is one such probe. The probes are useful for producing a microarray for predicting, measuring and displaying gene expression in samples derived from human placenta. The probes are useful for antenatal diagnosis of human genetic disorders.
               Probe #22910 used to measure gene expression in human placenta sample.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ctgcagaaaggagagaaaatcccttggctctaaaatgacatctggagaagtgaagacaag 145

The present sequence is one such probe. The probes are useful for producing a microarray for predicting, measuring and displaying gene expression in samples derived from human placenta. The probes are useful for antenatal diagnosis of human genetic disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      271

The present invention relates to phosphatase polypeptides, nucleotide sequences encoding them, as well as various products and methods useful for the diagnosis and treatment of various phosphatase-related diseases and conditions. Substance that modulates the activity of phosphatase and conditions. Substance that modulates the activity of phosphatase polypeptide is used to treat immune-related diseases and disorders, cardiovascular disease, brain or neuronal-associated diseases and metabolic disorders, including cancers of tissues, cancers of hematopoletic origin, diseases of central and peripheral nervous system, Alzheimer's disease, Parkinson's disease, multiple sclerosis, amyotrophic lateral sclerosis, viral infections, infections caused by prions, bacteria and fungi, ocular diseases, diabetes, migraines, pain, sexual dysfunction, mood disorders, attention disorders, neurological disorders, hypotension, hypertension, psychotic disorders, neurological disorders, dyskinesias and organ transplant rejection The present sequence is a DNA encoding human SCP006 phosphatase (DSP) and MAP and MAP and MAP SCP060 gene maps to chromosomal position

Sequence 636 BP; 123 A; 207 C; 182 G; 124 T; 0 other;

in gene therapy. A composition containing a polypeptide or polynucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral nervous system, such as peripheral nervous injuries, peripheral nervous system diseases, such as localised neuropathies and central nervous system diseases, such as Alzheimer's, Parkinson's disease, Huttington's disease, amyotrophic lateral sclerosis, and Shy-Drager Syndrome. Other uses include the utilisation of the activities such as: Immune system suppression, Activin/inhibin activity, chemotactic/chemokinetic activity, haemostatic and thrombolytic activity, cancer diagnosis and therapy, drug screening, assays for receptor activity, arthritis and inflammation, leukaemias and C.N.S disorders.

Note: The sequence data for this patent did not form part of the printed specification.
                                                                                                                                                                                                                                                                   the encoded polypeptides (AAM38642-AAM42213) with nootropic, immunosuppressant and cytostatic activity. The polynucleotides are useful
                                                                                                                                                                                                                                                 to human nucleic acids (AAI57798-AAI61369) and

This invention relates to an isolated dual specificity phosphatase-9 (DSP-9) and its variant. The DSP-9 protein has the ability to dephosphorylate an activated mitogen activated protein (MAP) kinase. Included in the invention are an expression vector comprising a polynucleotide encoding the DSP-9 protein, a host cell transformed by the expression vector, and an antibody that specifically binds to DSP-9. DSP-9 has cytostatic; immunosuppressive; antiallergic; and antiproliferative activity. DSP-9 modulating agents are useful for modulating a proliferative response, differentiation or survival of cell which displays contexting inhibition of cell growth, anchorage independent growth or an altered intercellular adhesion property, in a patient. DSP-9 agonists and antagonists are also useful for treating a disorder associated with DSP-9 activity such as Duchenne muscular dystrophy, cancer, graft-versus-host disease, autoimmune disease, albormal cell growth, abnormal cell prowth, abnormal cell proliferation and cell cycle abnormalities. The present sequence

cardiovascular disease, brain or neuronal-associated diseases and metabolic disorders, including cancers of tissues, cancers of haematopoietic origin, diseases of central and peripheral nervous system, Alzheimer's disease, Parkinson's disease, multiple sclerosis, amyotrophic lateral sclerosis, viral infections, infections caused by prions, bacteria and fungi, ocular diseases, diabetes, migraines, partins, bacteria, and fungi, ocular diseases, diabetes, migraines, pain, sexual dysfunction, mood disorders, attention disorders, cognition disorders, hypotension, hypertension, psychotic disorders, neurological disorders, dyskinesias and organ transplant rejection. The present sequence is a DNA encoding human SCPO14 phosphatase polypeptide. This sequence is classified as dual specificity phosphatase (DSP) and MAP kinase phosphatase (MKP). SGP014 gene maps to chromosomal position
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Phosphatase; gene therapy; enzyme; cancer; pathophysiological hypoxia; cardiac dysfunction; vascular disorder; myopathy; ectodermal dysplasia; congenital muscle disorder; Papillon-Lefevre syndrome; Cowden disease; Moeblus syndrome; Bjornstad syndrome; Bannayan Zonana syndrome; schizophrenia; hamartoma; ss.

The present invention relates to phosphatase proteins and coding. Sequences. The present sequence is one such phosphatase coding sequence. Phosphatases are enzymes that catalyse the dephosphortation of proteins modified by phosphorylation of serine, threonine or tyrosine residues. The phosphatases are useful for treating a variety of diseases: for example cancer e.g. breast, urogenital, prostate, head, neck, lung cancers, synovial sarcomas, renal cell carcinoma, non-small cell lung cancer, hepatocellular carcinoma, pancreatic endocrine tumours, stomach parhophysiological hypoxia, cardiac dysfunction and/or vascular disorders, myopathies, congenital muscle disorders, Pepillon-Lefevre syndrome, Cowden disease, ectodermal dysplasia, Moeblus syndrome, blornsted syndrome, Bannayan Zonana syndrome, schizophrenia and
                                                                                                                                                                                                                                                                                                     New protein phosphatase polypeptide for diagnosing and treating phosphatase related disorders such as cancer, schizophrenia, cardiac dysfunction and/or vascular disorders

Ξ (CURA-) CURAGEN CORP. Shimkets RA,

WPI; 2000-602362/57. P-PSDB; AAB42334. Novel nucleic acids and peptides derived from open reading frame X, useful for treating e.g. cancers, proliferative disorders, neurodegenerative disorders and cardiovascular disease -

Claim 5; Page 3391-3392; 5507pp; English.

antiinflammatory; antibacterial; antiviral; antifungal; antirheumatic; antiinflammatory; antibacterial; antiviral; antifungal; and antianaemic. The sequences can be used for determining the presence of or predisposition to, or preventing or treating pathological conditions associated with an ORFX-associated disorder. The nucleic acids can be used to express ORFX proteins in gene therapy exctors. The proteins and nucleic acids may be used to treat cancers, proliferative disorders, neurodegenerative disorders, osteoarthritis, graft vs host disease, cardiovascular disease, diabetes mellitus, hypertension, hypothyroidism, cholesterol ester storage, systemic lupus AAC74446 to AAC77606 encode the proteins given in AAB40237 to AAB43397, which represent the human ORFX open reading frames 1 to 3161. The ORFX sequences have activities such as: cytostatic; hepatotropic; vulnerary; antipsoriatic; antiparkinsonian; nootropic; neuroprotective; osteopathic; anticonvulsant; antiarthritic; immunosuppressant; immunostimulant; cardiant; thrombolytic; coagulant; vasotropic; antidiabetic; hypotensive; dermatological; immunosuppressive;

New cardiovascular system associated protein tyrosine phosphatases are used in the diagnosis and treatment of e.g. immune disorders, anti-proliferative disorders, metabolic disorders and cardiovascular

disorders

```
This sequence encodes a cardiovascular system associated protein tyrosine phosphatase 4 (CSAPTP). The CSAPTP nucleic acid and protein molecules are used to modulate regulation of cellular processes. CSAPTP nucleic acid and protein molecules and modulators of CSAPTP activity and cacid and protein molecules and modulators of CSAPTP activity and cacid and protein molecules and modulators of CSAPTP activity and disorder characterized by aberrant CSAPTP expression or activity. These disorder characterized of immune disorder, an anti-proliferative disorder, a proliferative disorder e.g. renal and lung carcinomas, a metabolic disorder e.g. disorder e.g. renal and lung carcinomas, a metabolic disorder rising cidabetes, viral pathogenesis, a neural disorder, a cardiovascular disorder phosphorylation of a phosphorylated protein. Anti-CSAPTP containing and recombinantly produced CSAPTP carlitate the purification of a phosphorylated protein in cell supernatant for evaluating from cells, to detect CSAPTP protein in cell supernatant for evaluating the level of CSAPTP expression and to monitor protein levels in tissue as procedure. CSAPTP nucleic acids, antibodies and protein molecules can be used in screening assays and in predictive medicine e.g. prognostic assays, monitoring clinical trials and pharmacogenetics.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           318

This sequence encodes a cardiovascular system associated protein tyrosine phosphatase 4 (CSAPTP). The CSAPTP nucleic acid and protein molecules are used to modulate requiation of cellular processes. CSAPTP nucleic acid and protein molecules and modulators of CSAPTP activity and expression can be used to treat a subject with a disorder characterized by aberrant CSAPTP expression or activity. These disorder characterized an immune disorder, an anti-proliferative disorder, a proliferative can immune disorder e.g. an immune disorder, an anti-proliferative disorder, a cardiovascular cisones, viral pathopanesis, a neural disorder, a cardiovascular cisones, viral pathopanesis, a neural disorder, a cardiovascular cisones, viral maproper phosphorylation of a phosphorylated protein. Anti-CSAPTP con improper phosphorylation of a phosphorylated protein. Anti-CSAPTP continued to disorder rising from cells, to detect CSAPTP protein in cell supernatant for evaluating content of a clinical testing procedure to determine efficacy of a treatment procedure. CSAPTP nucleic acids, antibodies and protein molecules can be procedure. CSAPTP nucleic acids, antibodies and protein molecules can be used in screening assays and in predictive medicine eg, prognostic measure monitorylar or acid nucleic acids and pharmaconemics.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New cardiovascular system associated protein tyrosine phosphatases are used in the diagnosis and treatment of e.g. immune disorders, anti-proliferative disorders, metabolic disorders and cardiovascular

                                                                                                               AA246138-246168 encode human phosphorylation effectors (PHSP), designated PHSP1-PHSP31 (the protein sequence for PHSP28 is not given in the specification). The sequences were isolated from cDNA libraries prepared from various human tissues. The PHSP proteins are useful for the diagnosis, treatment and prevention of proliferative disorders, immune disorders and neuronal disorders. The PHSP proteins form pharmaceutical compositions which useful for treating or preventing disorders associated with decreased PHSP expression/activity. PHSP

The present sequence is given in a method relating to the phosphatean sequence is given in a method relating to the phosphatease DSP-7. The antibody specific to DSP-7 and the antisense polynucleotide of the nucleic acid encoding DSP-7 are useful for detecting DSP-7 expression in a sample which comprises an RNA or cDNA preparation. The antibody is linked to a support material and a detectable marker and the amount of DSP-7 polynucleotide hybridisation assay. The isolated DSP-7 polynucleotide is determined using PCR or hybridisation assay. The isolated DSP-7 polynucleotide is useful for screening agents that modulate DSP-7 activity. The identified agents are useful for treating Duchenne muscular dystrophy, cancer, graft-versus-host disease, autoimmune diseases, allergies, metabolic diseases, abnormal cell growth, abnormal cell proliferation and cell cycle abnormalities.
                                                                                                                                                                                                                                                                                                                      Novel dual-specificity mitogen-activated protein kinase phosphatase polypeptide used in assays to identify agents that modulate the enzyme's activity, which are useful for treating cancer and autoimmune diseases
                                                                                                                                                                                                                                                                                                                                                                                                                         Claim 7; Fig 1; 70pp; English
